- I. Introduction
- II. Report by Umebayashi Hiromichi
- III. Nautilus invites your responses

I. Introduction

Umebayashi Hiromichi, Founder and President of Peace Depot, a non-profit organization for peace research and education in Japan, writes, “These operations by US naval vessels homeported in Yokosuka tasked with ballistic missile defence of the US itself is an absolutely new development, one not provided for under the Japan-USA Mutual Security Treaty. This matter must be fully discussed from the point of view of control of military activities by law in both the international and national spheres.”

The views expressed in this article are those of the author and do not necessarily reflect the official policy or position of the Nautilus Institute. Readers should note that Nautilus seeks a diversity of views and opinions on contentious topics in order to identify common ground.

II. Report by Umebayashi Hiromichi

-“Missile Defence Response to the July 5, 2006 North Korean Missile Test By US Naval Vessels Home-Ported At Yokosuka”  
By Umebayashi Hiromichi

Summary

For many years, Peace Depot has studied US Navy internal documents, and over the past year, one research theme has been the activities of Aegis-equipped ships based in Yokosuka engaged in missile defence duties.<sup>2</sup> This analysis of the activities of the US Seventh Fleet around the time of the July 5, 2006 North Korean missile tests is part of

<sup>1</sup> Translated by Richard Tanter.

<sup>2</sup> Umebayashi Hiromichi, US Navy Set Missile Defence Operations Area in the Sea of Japan 190 Kilometres West of Okushiri: Japan as a Base for the Defense of the US Homeland, NAPSNet Special Report 06-42A May 30th, 2006. < <http://www.nautilus.org/napsnet/sr/2006/0642Umebayashi.pdf>>. See also Umebayashi Hiromichi, Japan as a Base for the Defense of the US homeland: US Navy Missile Defense Operations in the Sea of Japan", NAPSNet Policy Forum 06-43A May 30th, 2006. < <http://www.nautilus.org/fora/security/0643Umebayashi.pdf>>

this work. This study draws together the results of analysis of the US Navy command histories and deck logs.

The command histories, together with the Congressional testimony of the head of the US Missile Defence Agency, demonstrate that US Navy Aegis-equipped ship patrols in the Sea of Japan after October 1, 2004 are a part of US national missile defence operations that assume the possibility of a North Korean missile attack on the American mainland – specifically long range surveillance and tracking of missiles. These records clearly show that the USS *Curtis Wilbur* and the USS *Fitzgerald* were the first and second ships respectively designated with this duty. For the first time, the command histories clearly specify the purpose of these patrols.

The results of the survey of the deck logs of the three Aegis-equipped ships home-ported at Yokosuka – the *Curtis Wilbur*, the *Fitzgerald* and the *John S. McCain* (hereafter, *McCain*) – clearly show that the three ships were engaged in duties related to the July 5<sup>th</sup> North Korean missile tests. The records also demonstrate that for the first time the US navy established Ballistic Missile Defence Operational Areas in both the Sea of Japan and in the Pacific Ocean. These operational areas are located on an almost direct line with the US X-Band radar facility deployed at the Shariki Communications Base. The Sea of Japan BMD Operational Area is approximately 285 km west of the Matsumae Peninsula in Hokkaido, and the Pacific BMD Operational Area is about 270 km east of Kujikaigan in Iwate Prefecture. The Aegis ships were on standby in two extremely small maritime zones about 30 kilometers across. Although the ships were on station for about three weeks, they headed for their homeport the night after the launch, their launch monitoring duty finished. So for the first time the location and duration of BMD duty of these Aegis-equipped vessels has been clearly identified in this study from US naval records.

This decklog data corroborates the evidence from Congressional testimony and from the command histories that the purpose of these interconnected BMD missions across the northern tip of Honshu is for the missile defence of the United States proper. The specific formation of this deployment is consistent with an assumption by the US military of a possible North Korean targeting of Hawaii with a Taepodong-2 missile.

These operations by US naval vessels homeported in Yokosuka tasked with ballistic missile defence of the US itself is an absolutely new development, one not provided for under the Japan-USA Mutual Security Treaty. This matter must be fully discussed from the point of view of control of military activities by law in both the international and national spheres.

### **Research method**

A request for inspection of documents was made to the US Naval History Center in Washington. After reading the documents, significant documents copied. This research concentrated on the period from November 2005 to October 2006. The deck logs discussed here were obtained in October 2006.

Command histories are required statements recording the important activities and events of a ship in the preceding year. Notwithstanding the fact that writing the command history is a specified responsibility of the captain, there are many cases where a ship's command history is missing.

Details of a ship's location and heading are recorded in the deck log three times a day (0800, 1200, 2000). In addition, the logs contain information about the ship's handling, its contacts with other ships, and information about any accidents etc. on board.

### **The command histories**

The 2004 command histories of the *Curtis Wilbur* and the *Fitzgerald* were obtained. The command history for the *Curtis Wilbur* recorded the ship's careful preparations as the US Navy's "first active Ballistic Missile Defense (BMD) ship" (see [Attachment 1](#)). It stated that "in mid-July after months of strenuous installations and training CURTIS WILBUR put to sea to test its BMD equipment and theory", and following another two months of BMD preparations moved to the Sea of Japan to begin "the first ever BMD patrol". "October 1<sup>st</sup> found CURTIS WILBUR on station and radiating its modified SPY-1D radar over North Korea in defense of the United States."

Similarly, the *Fitzgerald* 2004 command history stated that from January to March 2004 the ship was in its homeport of San Diego undergoing refitting for BMD-capability, and in September moved to its new homeport in Yokosuka (see [Attachment 2](#)). The command history then records that through its patrols in the Sea of Japan in November and December, the *Fitzgerald* became "the second ship to participate in the national Ballistic Missile Defense Limited Defense Operations (LDO)".

This information from the command histories closely corresponds with Congressional testimony given in May 2005 by Lieutenant-General Henry A. Obering III, U.S. Air Force. In brief, Obering stated that the Aegis ships started deployment in the Sea of Japan to establish "a limited defense capability for the United States against a long-range North Korea missile threat" and "to provide long-range surveillance and tracking data to their (our) battle management system" (see [Attachment 3](#)).

Together with the corroborating evidence of the annual record by the commanders of the ships that actually carried out the missile defense duty this testimony proves that Japan has been made into a stronghold for operations directly in defense of the United States itself. The names of the first and second ship were confirmed. (As our earlier study showed, these ships were also accompanied by a third ship, the *McCain*.)

We should naturally anticipate that this basic duty would also be carried out in June-July 2006 at the time of the Taepodong 2 missile launch by North Korea.

### **Decklogs**

#### 1. Voyages/Cruises

On June 10<sup>th</sup>, all Aegis destroyers based in Yokosuka with the exception of the USS *Stethem*, which was undergoing repairs at the time, left Yokosuka as part of the *Kitty Hawk* Strike Group, heading for waters off Guam. The *Fitzgerald* decklog for June 11<sup>th</sup> records that the ship “is steaming with the USS *Kittyhawk* (CV-63), USS *Cowpens* (CG-63), the USS *Curtis Wilbur* (DDG-59), the USS *Lassen* (DDG-82), USS *John S. McCain* (DDG-56)” (see [Attachment 4](#))<sup>3</sup>.

The first to record 2006 BMD duty was the *Fitzgerald*. The ship returned to Yokosuka with rudder damage, and immediately after leaving port at 14.25 on June 14<sup>th</sup> the decklog recorded the ship as sailing “From Yokosuka, BMD” (see [Attachment 5](#)). After this the *Fitzgerald* transited the Tsugaru Strait, proceeding straight for the Japan Sea, and on June 16<sup>th</sup> entered what was to be identified as the Japan Sea BMD Operational Area. The *Fitzgerald* remained on station in this operational area (often with its engines stopped), from this time until July 7<sup>th</sup>, the night after the North Korean missile test, when it departed for its homeport of Yokosuka. The *Fitzgerald* was thus on station in the operational area for 21 days. [Attachment 6](#) shows the location of the ship as recorded in the decklog.

On June 15<sup>th</sup>, the day after the *Fitzgerald* left Yokosuka for BMD duty, the *Curtis Wilbur* decklog records the ship as travelling from “Modloc [Modular Location] FDM, To BMD”, meaning it was moving from the Farallon de Medina Target Range (FDM)<sup>4</sup> Modular Location [Modloc] operational area just north of Guam to BMD duties (see [Attachment 7](#)). Perhaps the two ships received BMD deployment orders about the same time. On June 18<sup>th</sup> 03:20 the decklog recorded “Enter BMD Box” as the ship entered the BMD operational area, the location later identified as the BMD Pacific Operational Area (see [Attachment 8](#)). On June 26 the *Curtis Wilbur* decklog recorded that the ship was moving “From BMD to New BMD”, traversing the Tsugaru Strait and entering the Japan Sea BMD Operational Area (see [Attachment 9](#)). The ship then stayed on this station until July 6<sup>th</sup>, and headed for Yokosuka the next day. The chart in [Attachment 10](#) shows the *Curtis Wilbur*’s path.

The *McCain*, previously also in waters off Guam, arrived in the Pacific Operational Area just as the *Curtis Wilbur* left that area for the Japan Sea Operational Area. Early on the morning of June 24<sup>th</sup>, the *McCain*’s decklog recorded the ship moving “From Guam OPAREA [Operational Area], Entering Tsugaru Straits” (see [Attachment 11](#)). The

---

<sup>3</sup> The decklog then erroneously states “Currently operating in the Sea of Japan”. The coordinates given place the ship in the Pacific.

<sup>4</sup> “The Farallon de Medinilla, an uninhabited 200-acre island, stands about 280 feet above sea level and its’ size is approximately 3 miles by 1/2 mile. The Farallon de Medinilla Target Range is located about 150 miles north of Guam and is leased from the Government of the Commonwealth of the Northern Marianas Islands. The Farallon de Medinilla Target Range is the Pacific Fleet’s only U.S.-controlled range available for live-fire training for forward deployed naval forces.” Cited in “Farallon de Medinilla (FDM) 16° 01' north latitude, 146° 04' east”, [GlobalSecurity.org](http://www.globalsecurity.org/military/facility/farallon-de-medinilla.htm). <<http://www.globalsecurity.org/military/facility/farallon-de-medinilla.htm>>

*McCain* entered the Pacific Operational Area (sometimes recorded as “the Tsugaru straits”, or as “waters near the entrance to the Tsugaru straits” on June 26<sup>th</sup> and remained in the area until it departed for Yokosuka early on the morning of July 7<sup>th</sup>. The chart in Attachment 12 shows the track of the *McCain*’s voyage.

With this rotation, the *Curtis Wilbur* and the *McCain* were on station for a total of 19 days in the Pacific BMD Operational Area.

The *Lassen*’s decklogs showed that it did not participate in BMD operations. After its activities with the Kitty Hawk Strike Group in waters near Guam the *Lassen* headed for Sasebo, which is close to the Korean Peninsula, and arrived there on June 29<sup>th</sup>. But even though no North Korean test launch had yet taken place, it left Sasebo for Yokosuka the next day, and remained there until July 8<sup>th</sup>.

To make these comings and goings more readily understandable, summary data from the decklogs is set out in Attachment 13: “Deck log summaries for missile defense duty in response to North Korean missile launch: June 11<sup>th</sup>, 2006 – July 8<sup>th</sup>, 2006.”

## 2. Operational Areas

When the latitude and longitude of the daily positions of ships are plotted on a map, it immediately becomes clear that the ships on BMD duties stayed within very narrow areas. These locations are generally recorded in the decklogs as “BMD Operational Area” (sometimes “Station”, “Box”, or “Modloc”). To specify these locations more clearly, detailed charts showing the plotted paths of the ships on station have been arranged in separate charts for three successive periods: between June 15<sup>th</sup> and July 7<sup>th</sup>.

- a. Detailed Chart I (Attachment 14), covering the period June 15 - June 25, shows the paths of the *Fitzgerald* and the *Curtis Wilbur*.
- b. Detailed Chart II (Attachment 15), covering the period from June 26<sup>th</sup> to 06:00 on July 5<sup>th</sup>, 06:00, just after the launch of the Taepodong II at 5 am, shows the *McCain* as well as the *Fitzgerald* and the *Curtis Wilbur* together on station.
- c. Detailed Chart III (Attachment 16) covers the brief period following confirmation of the Taepodong II launch from July 5<sup>th</sup>, 06:00 to July 7<sup>th</sup>, the end of the BMD mission.

Two very concentrated operational areas can be defined in Detailed Charts I and II. Although the daily plotted positions overlap each other and may be a little difficult to follow, it is remarkable to see how densely those plotted ship positions are concentrated in the two narrow sea areas over a 20-day period. One can see some short trips from those concentrated area to slightly separated locations: these were for underway replenishment and other unidentified activities at separate rendezvous points.

### 1. BMD Japan Sea Operational Area

41<sup>0</sup>28" north, 136<sup>0</sup>32" east.

About 30 km across.

About 285 km west of the west coast of the Matsumae Peninsula, Hokkaido.

## 2. BMD Pacific Operational Area

40<sup>0</sup>12" north, 145<sup>0</sup>00" east

About 30 km across.

About 270 km east of the coast of Honshu at Kujikaigan, Iwate prefecture.

A third area can also be identified. Immediately following the launch of the Taepodong II at about five in the morning of July 5<sup>th</sup> the *Curtis Wilbur* and the *Fitzgerald* concentrated on a small area in the Japan Sea about 40 kms east of the established Operational Area, at 41<sup>0</sup>25" north, 137<sup>0</sup>00" east. This was probably related to a certain after action measure, for instance to avoid troubles with any possible violation of the EEZ mid-point line between Japan and Russia.

The Japan Sea and Pacific Operational Areas are almost on a direct line that transects the Shariki Communications Base, where the US X-band radar facility has been deployed, about 320 km and 400 km from Shariki respectively.

The US X-band radar at Shariki, established for BMD purposes, was agreed to between Japan and the US in the recent negotiations on the US Forces realignment reportedly began operations in June, sooner than scheduled, to respond anticipated North Korean missile launch.

## 3. The records for July 5<sup>th</sup>.

Since deck logs are not records of mission objectives, there is almost no mention of BMD activity in relation to the July 5<sup>th</sup> North Korean missile launch. At 5 am, that is, at the time of the third missile launch, the Taepodong II launch, there was the following series of entries in the *Fitzgerald's* decklog (see [Attachment 17](#)):

05.00 IR [infra-red] data received.

05.03 North Korean missile launched.

05.04 Missile exploded 40 seconds after launch.

This description confirms the interesting fact that the Aegis ship was connected to a direct satellite data and communication link while on station and could know not only launch but also the fact of the missile explosion almost instantaneously.

## 4. Liaison with the Self Defense Forces.

The decklogs mention link-ups with the MSDF refuelling vessel *Hamana* (AOE424) and the MSDF Aegis-equipped destroyer *Kongo* (DD173).

The *Hamana* carried out refuelling at sea of the *Curtis Wilbur* on two occasions. The first was on the night before the *Curtis Wilbur* moved from the Pacific Operational Area to the

Japan Sea Operational Area, over three hours from 18:44 to 21:59 on June 25<sup>th</sup> (see [Attachment 18](#)<sup>5</sup>). The decklog records “From BMD To RAS with HANAMA” [RAS = Replenishment at Sea].<sup>6</sup> The second refuelling took place on June 27<sup>th</sup> in the Japan Sea Operational Area, over two hours from 18:54 to 20:51. There is a question as to whether or not these refuelling activities are violations of the Acquisition and Cross-Servicing Agreement [ACSA].<sup>7</sup>

The *Kongo* linked-up with the *Fitzgerald* early on the morning of June 20<sup>th</sup> in the Japan Sea Operational Area. Chief Operations Specialist Madott was moved from the *Kongo* to the *Fitzgerald* (see [Attachment 19](#)).

05.39 Boat deck manned and ready.  
05.40 Saber is in the water [“Saber” = name of an assault craft  
05.44 Saber is away.  
05.51 Saber is enroute to Kongo for pax transfer - OSC Madott.  
05.56 Saber is alongside Kongo.  
05.59 Saber is disembarked.  
06.05 Sabre is alongside.  
06.07 Saber is at the rail, OSC Madott is onboard.  
06.09 Saber is in the skids

This is a concrete example of the *Kongo* working and communicating together precisely with the *Fitzgerald*. Most likely MSDF personnel were receiving one-on-one operational technical training.

## Conclusions.

One extremely interesting analytical issue is the basis for the establishment of the Japan Sea and Pacific BMD Operational Areas. Geography is part of the reason, but not the complete explanation. But a reliable analysis is possible by taking into consideration the *Curtis Wilbur* and *Fitzgerald* command histories and their corroboration by the 2006 Congressional testimony of the head of the Missile Defence Agency, Henry A. Obering III, and the operational activities of the Aegis ships shown in their decklogs.

The chart in [Attachment 20](#) shows the location of the two operational areas, their alignment with Shariki, and also shows the Great Circle routes from the North Korean

---

<sup>5</sup> The attachment is meant to show the name of Hamana recorded on the log. As for time, 18:44 is seen on the attachment as “UNREP DETAIL”, which means Underway Replenishment details were set. The page for 21:59 is not attached.

<sup>6</sup> The decklog misrecords “*Hanama*” for “*Hamana*”. The MSDF was recorded as “JDF”.

<sup>7</sup> The Japan-US Acquisition and Cross-Servicing Agreement (ACSA) amended in 1999 and 2004 allows logistical mutual provision and cross-service between the two armed forces only under circumstances such as joint exercises, UN peace-keeping operations, and legally defined situations such as armed attacks against Japan and significant situations in areas surrounding Japan.

Musudanri missile base to Honolulu, as well as the splashdown point for the 1998 Taepodong I launch. The chart in Attachment 21 shows the Great Circle routes from Musudanri and Kittaeryong to other potential US and Okinawan targets, as well as the splashdown area for the other missiles besides the Taepodong II that were tested on July 5, 2006.

### 1. Missile Course

The two operational areas in the Japan Sea and the Pacific make sense in relation to the possible defense of Hawaii. The three radars – Shariki, together with the Aegis ships in the two operational areas – together cover the Great Circle route to Hawaii, especially at points where a long-range missile from North Korea is still in the second stage or third stage acceleration, when interception is theoretically more likely.

The three Aegis ships on station were carrying out long-range surveillance and tracking duties, even though at present they lack intercept capacity. The important point to understand is that this formation of radar sites is the source of data supplied for the missile defence of the United States proper/mainland, and consequently is tied to the entire combat system (see Obering's testimony in Attachment 4). By supplying missile trajectory data to the Shariki radar base, the Japan Sea and Pacific Aegis ship deployments were intended the Shariki X-band radar facility's very high capacity for missile discrimination extend for the longest period possible.

The flight path of the 1998 Taepodong I launch could be an important reference. for the missile launch to due east, as happened on the occasion of the Taepodong I launch test, or launch test pretending to be satellite launch.

### 2. Position

In the event of an attack towards the US west coast, deployment in the Japan Sea in the most westerly position possible is desirable. But, given the position of the mid-point line between Japanese and Russian maritime territories, the Japan Sea Operational Area is at its most westerly possible location. It is possible the location of the Pacific Operational Area, exactly 400 kms from the Shariki radar site in some way reflects the performance of the radar facilities, but this is not certain.

Apart from these considerations, it is also important to consider the present locations from the point of view of intercept simulations. As already mentioned, although the three Aegis ships involved in the BMD duties only possessed long-range surveillance and tracking capacity, the US Navy Aegis cruiser USS Shiloh has since been deployed to Yokosuka, and it possesses an interception capacity. There has been a report that of the three Aegis destroyers involved in these BMD operations were to be upgraded to interception capability by the end of 2006. It is possible that the US used the North Korean missile launch to train for an interception drill. In the standard understanding of missile defense, the possibility of interception is greatest in the boost phase and the second stage and third stage acceleration when the rocket is moving relatively slowly and the heat plume of its rocket motor is most visible. It is possible that this was a factor in deciding the location of the Operational Areas.

### 3. Rule of law

It is impossible to avoid the conclusion that the present missile defense arrangement, which covers only very northern tip of Honshu (Mainland Japan) with two MD operational sea areas on the western and eastern sides of the Shariki X-band radar, is intended for the missile defense of the US proper including Hawaii. That it is secondarily connected to the defense of Japan is just an excuse and does not alter this primary fact. Since this is even admitted in Congressional testimony, a plea of alternative interpretations are unpersuasive.

There is in fact a recurring problem of the Japanese government failing to prevent, and indeed, permitting the US military in Japan violate the provisions of the Japan-US Mutual Security Treaty, specifically Article 5 (the defense of the Japanese mainland/proper) and Article 6 (the Far East clause).<sup>8</sup> There has been a serious issue of US bases in Japan being developed into frontline bases and supply bases for Afghanistan, Iraq, and the Persian Gulf.

This time the situation is different. The use of US bases in Japan directly for the defense of the United States proper is something quite new. Strict rule of law must be followed in relation to the military, and particularly in case of a foreign military using the territory of an independent state. This is the foundation of civilian control.

The government and the Diet should not ignore the implications of this research. After North Korean nuclear test in October 2006, there is a political atmosphere in Japan that Japan should not demand anything inconvenient to the US military force in Japan so as to give them a free-hand to protect Japan. However, it is more necessary than ever in this circumstance to reaffirm the importance of keeping the military strictly within the rule of law.

(3) Narrative History  
(4) Commanding Officer Biography  
(5) Change of Command Ceremony Pamphlet

1. Pursuant to reference (a), enclosures (1) through (5) comprise the 2004 calendar year history of USS CURTIS WILBUR (DDG 54).

A handwritten signature in cursive script that reads "J. T. Lauer III".  
J. T. LAUER III

Commodore Perez came aboard to witness the changing of CURTIS WILBUR's command from Commander A. J. Abramson to Command J. T. Lauer. On March 29<sup>th</sup>, 2004 in a ceremony rolling in the waves of the Sea of Japan the crew of CURTIS WILBUR welcomed a new Captain and said farewell to another.

The next stop for CURTIS WILBUR was a port visit in the other United States Navy base in Japan at Sasebo. Over the span of a week CURTIS WILBUR conducted some much needed repairs to its engineering plant as well as giving the crew some much needed time ashore following its time off Korea. Soon after, CURTIS WILBUR returned home to Yokosuka in late April to begin months of preparations to become the Navy's first active Ballistic Missile Defense (BMD) ship.

For the next three months CURTIS WILBUR underwent extensive alterations to its communications and combat systems suites in preparation for the first BMD patrol. With the assistance of experts from Port Hueneme Naval Surface Warfare Division, Ship Repair Facility Yokosuka, and Center for Surface Combat Systems Yokosuka, CURTIS WILBUR was able to transform both its equipment and training to prepare for this vanguard deployment. CURTIS WILBUR sailors used their expertise to not only learn their new equipment and mission but to also expand upon it and establish doctrine and training for other BMD ships to follow.

In mid-July after months of strenuous installations and training CURTIS WILBUR put to sea to test its BMD equipment and theory and also to conduct its Destroyer Squadron 15 Mid-Cycle Assessment. With both evolutions passed and validated CURTIS WILBUR sailed south toward a groundbreaking and unprecedented port visit to Da Nang, Vietnam.

As only the second United States Navy ship to visit Vietnam in thirty years, CURTIS WILBUR sailors were more than aware as to the uniqueness of the port visit and the opportunities it offered. CURTIS WILBUR sailors made most out of their time conducting numerous site sightseeing and shopping tours. Several receptions and community projects helped to reawaken and strengthen ties that had not existed in Da Nang since the American departure in 1973. Through five miraculous days CURTIS WILBUR sailors had the experience of a lifetime opening new doorways for their country and themselves.

Following Da Nang, CURTIS WILBUR returned to Yokosuka for another two months of BMD preparations. Using much the same regimen as the early spring, CURTIS WILBUR continued with the extensive installations and training that was needed. The first ever BMD patrol began the last week of September as CURTIS WILBUR sailed north from Yokosuka bound for the Sea of Japan.

October 1<sup>st</sup>, 2004 found CURTIS WILBUR on station and radiating its modified SPY-1D radar over North Korea in defense of the United States. Through two weeks of this proof of concept patrol CURTIS WILBUR avoided the swipes of both the BMD critics and two typhoons to provide the best possible coverage for this new mission.

successful INSURV inspection in June, sixty percent of the crewmembers from USS O'BRIEN (DD 985), previously forward-deployed to Yokosuka, Japan, swapped over to FITZGERALD in a "Super Sea Swap." Following a two-week transition period, FITZGERALD completed a successful Command Assessment of Readiness and Training (CART) II/Initial Assessment (IA) visit by Afloat Training Group, Pacific (ATGPAC) and rolled into an intensive and compressed nine-week Unit Level Training Phase. Due to the large crew turnover, the ship was required to re-certify in all nineteen SURFORTRAMAN certification areas, achieving Training Level (TL) I proficiency in 17 of 19 certification areas to achieve an overall C2 rating. FITZGERALD completed Final Evaluated Problem on 3 September and transited west, arriving in Yokosuka, Japan on 30 September. Of note, FITZGERALD completed the first Tactical Tomahawk Weapon Control System (TTWCS) Pacific Fleet Cruise Missile Tactical Qualification, Tomahawk (CMTQ-T) and CMTQ in two consecutive weeks with her Combat Systems Training Team (CSTT) packages have become the Fleet's standard.

FITZGERALD's Supply Management Inspection (SMI) was completed in November with grades of 92.97% for Stores, 93.71% for Food Services, 95.48% for Retail Operations, OUTSTANDING for Disbursing management, and OUTSTANDING for Postal Management.

At the same time, FITZGERALD was the winner of the Commander, Pacific Fleet Retention Excellence Award for FY04. Commander, Destroyer Squadrons TWO THREE and FIFTEEN recognized FITZGERALD Sailors with two Destroyer Squadron Sailors of the Quarter and two Junior Sailors of the Quarter in 2004.

At the close of November and through 19 December FITZGERALD was the second ship to participate in the national Ballistic Missile Defense Limited Defense Operations (BMD LDO). For weeks FITZGERALD kept vigilant guard and remained undetected while helping refine the Navy's role and experience in BMD LDO.

FITZGERALD continued her fruitful Partnership in Education program with Solana Beach Elementary School while in San Diego, where Sailors spent numerous hours visiting and interacting with the elementary students. In April 2004, over forty-two crewmembers participated in a massive Community Relations project during a port visit to Puerto Vallarta, where the exterior of a two-story elementary school was repainted. In Yokosuka, FITZGERALD Sailors continued to serve their community helping with the clean-up of a local cemetery and donating over 49,000 yen to victims of the recent earthquake in Niigata, Japan. During her recent port visit to Pusan, over thirty FITZGERALD Sailors volunteered to help with the clean up of a local orphanage and visit with the children there. Additionally, the crew donated over \$9,250 to the Navy and Marine Corps Relief

## Attachment 3

**Congressional testimony (exerpts)**  
**by the Director of the Missile Defense Agency, Lt-Gen. Henry A. Obering III, USAF**  
**House Armed Services Committee, Subcommittee on Strategic Forces.**  
**March 15, 2005**

### **Missile Defense Approach—Layered Defense**

With the initial fielding last year of the Ground-based Midcourse Defense and Aegis surveillance and track capabilities of this integrated system, **we are establishing a limited defensive capability for the United States against a long-range North Korean missile threat.** At the same time, we are building up our inventory of mobile interceptors to protect coalition forces, allies and friends against shorter-range threats. With the cooperation of our allies and friends, we plan to evolve this defensive capability to improve defenses against all ranges of threats in all phases of flight and expand it over time with additional interceptors, sensors, and defensive layers. . .

### **Initial Fielding of Block 2004**

We stated last year that, by the end of 2004, we would begin fielding the initial elements of our integrated ballistic missile defense system. We have met nearly all of our objectives. We have installed six ground-based interceptors in silos at Fort Greely, Alaska and two at Vandenberg Air Force Base in California. We completed the upgrade of the Cobra Dane radar in Alaska and the modification of six Aegis ships for long-range surveillance and tracking support. These elements have been fully connected to the fire control system and are supported by an extensive command, control, battle management and communications infrastructure. . .

Since October 2004, we have been in a “shakedown” or check-out period similar to that used as part of the commissioning of a U.S. Navy ship before it enters the operational fleet. We work closely with U.S. Strategic Command and the Combatant Commanders to certify missile defense crews at all echelons to ensure that they can operate the ballistic missile defense system if called upon to do so. We have exercised the command, fire control, battle management and communication capabilities critical to the operation of the system. **The Aegis ships have been periodically put on station in the Sea of Japan to provide long-range surveillance and tracking data to our battle management system.**
